

Download 3clipz DTB v1.6 template from Kreslik...

<http://kreslik.com/forums/viewtopic.php?t=1801>

I've remove the SHI channel and turned off the gauges to make the Charts more clear. If you want you can do the same.

Then get the 3_Level_ZZ_Semafor indicator from TRO's indicator collection. It's available in the motherload.

http://www.kreslik.com/forums/portal.php?topic_id=1945

And put that indicator on top of the 3clipz 1min template.

Also put ZigZag indicator (in custom indicators) witch comes with MT4 on top of the same template.

Now you can save this modified template so you don't have to do that all over again in the future...

My trading method.

[I trade from 2GMT to 13GMT]

As Floss have mentioned above, I'm trading from semafor to semafor. Only sema2's and 3's.

As i have noticed over four month of demo trading the DTB system, most of the time price bounces off the semafor's. One's you set up your trading template as above mentioned, you can clearly see this.

So basically what I do is take every trade from sema2's and sema3's.

But their is a exception. Enter for a trade on the DTB trigger lines when sema2 or sema3 presence on top of a candle (not the semafor that appear in the background of the chart. but pay attention to those semafor's too)

I'm only entering for the trade if the price range for last 45-60minuts is over 20pips (15+ for EU and 25+ for GJ)...

The reason for that is SPREAD.

Price normally won't retrace 100% off the semafor all the time. So by entre the trade only when there is a good range, gives us more chance of getting a profit after the spread.

If you enter the trade when the range is below 10pips it's more than likely you'll lose that trade. If you have very low spread (ie: MBT), then you can reduce the range.

Take Profit margin...

Since this is a scalping method, I'm looking for 10pips. But you can also ride the price move to the next semarfor (i do this more often when the price range is above 30pips). This will give more profit margins. But make sure you secure your positive pips by adding SL in a way that you get +1-+5 pips if the price reversed suddenly. So you'll be safe. +1pip is always better than -10pips :D)

Stop Loss...

My stop losses are ranging from 14-20pips.

If you have the guts to take risk you can widen your SL and stay in the trade longer, so you can re-enter a trade witch goes against you and close both for BE or for a profit(as described in TRO's DTB system). But make sure you aware of news event, 'coz the re-entry won't gonna work in the violent news releases.
